W 1.2311: A prehardened mold steel (300 HB/32 HRC)

Material properties
Standard prehardened steel designed for plastic mold industry.

For which tools
Plastic injection mould cores and cavities, extension dies for thermoplastics.

For which plastics
Thermoplastics (PE, PP, PS), thermosetting plastics, transparent melts.

ACCORDING TO STANDARD

> SYMBOL 40 CrMnMo7
> WERKSTOFF 1.2311
> AISI ≈ P20

MECHANICAL PROPERTIES

1.2311 is delivered quenched and tempered to 280 – 325 HB (29 – 33 HRC).

METALLURGICAL PROPERTIES

Internal soundness
All plates are ultrasonically tested. The acceptance standards of ASTM A578.96.S9 is guaranteed.

Grain size
Uniform 7/8 grain according to ASTM E112.

Cleanliness
W1.2311 is melted in an electric arc furnace and refined through a VOD or DH process - consequently, the content of non metallic inclusions is reduced to an extremely low level. This ensures a good polishability and chemical etching ability. Non metallic inclusions content is assessed in accordance with ASTM E45 Method A (“worst field”).

Homogeneity
W1.2311 has an excellent hardenability resulting in good uniformity of hardness and microstructure.

HEAT TREATMENT

For specific applications where mechanical properties higher than 300HB are required, hardening can be performed in the following way:

> heating about 850 °C - (1560 °F) with a holding time 1 hour/25 mm (1 hour/inch)
> water, oil or air quenching depending on thickness (see C.C.T diagram)

Tempering
- Uniform heating at the selected tempering temperature (see tempering curve),
- Holding time of one hour per inch of total thickness,
- Double tempering with complete cooling to room temperature for each treatment.

SURFACE TREATMENT

The quality of surface treatments depends on the surface roughness and polishing quality. Homogeneity of hardness, microstructure and good cleanliness ensure a good behaviour for chromium plating, nickel plating or nitriding. Nevertheless, after hard - chrome plating, the steel should be tempered for about 4 hours at 180°C (356°F) to avoid any hydrogen embrittlement.

</table>

Heating conditions:
150°C/h up to 875 °C, holding time 10 minutes,
270°F/h up to 1607 °F, holding time 10 minutes.
MACHINING
W1.2311 grade performs very well in drilling and in milling using high speed steel or carbide tools. Cutting conditions (cutting speed, feet rate, etc.) depend on the tool, but W1.2311 is a well known grade for which any tool maker can provide cutting conditions adapted to its tools.

ELECTRICAL DISCHARGE MACHINING (EDM)
This method of machining can be used on W1.2311 grade. Precaution should be taken to avoid the presence, after machining, of a rehardened surface layer (“white layer”). This layer should be completely removed by grinding and polishing.

POLISHING
W1.2311 has a good polishability in quenched and tempered condition. After grinding, polishing shall be made with aluminium oxide or diamond paste.

TEXTURING
W1.2311 is particularly adapted for texturing. Industeel steelmaking process leads to uniform structure and homogeneous hardness which ensure accurate and consistent pattern reproduction.

WELDING
GTAW is the recommended process to ensure a clean weld without sulphides, porosities or oxides which affect properties of the weld such as chemical etching ability, polishability... Pre and postheating treatment must be achieved to ensure crack free welds. Industeel has developed a specific procedure to limit the risks of cracking and improve the response of the welded area to polishing and etching. For more information about it, please contact us.

DELIVERY CONDITIONS

DIMENSIONAL PROGRAM

<table>
<thead>
<tr>
<th>Thickness</th>
<th>Width</th>
</tr>
</thead>
<tbody>
<tr>
<td>7 - 150 mm (.27” - 5.9”)</td>
<td>1000 - 2500 mm (39 - 98.4”)</td>
